

IN THE CLAIMS:

The text of all pending claims, (including withdrawn claims) is set forth below. Cancelled and not entered claims are indicated with claim number and status only. The claims as listed below show added text with underlining and deleted text with ~~strikethrough~~. The status of each claim is indicated with one of (original), (currently amended), (cancelled), (withdrawn), (new), (previously presented), or (not entered).

Please CANCEL claims 11-14 and 25 AMEND claims 15-18, 21-24 and 26 in accordance with the following:

1-10 (cancelled)

11. (cancelled).

12. (cancelled)

13. (cancelled)

14. (cancelled)

15. (currently amended) ~~The A method according to Claim 14 for data transmission in a wireless communication system, comprising:~~

~~emitting a subscriber data signal assigned to a subscriber from at least two antenna devices using a diversity method;~~

~~emitting a reference signal assigned to the subscriber from only one of the at least two antenna devices; and~~

~~measuring propagation delay of the reference signal to determine runtime critical system parameters for a positional determination of the subscriber, wherein~~

~~the antenna device used to send the reference signal is switched between the at least two antenna devices~~

when the antenna device used to send the reference signal is switched, the propagation delay is compared for the at least two antenna devices, and

for future propagation delay measurements, the antenna device used to send the reference signal is selected to be the antenna device associated the smaller propagation delay.

16. (currently amended) The method according to Claim 1415, wherein when the antenna device used to send the reference signal is switched, a comparison is made, and

for future propagation delay measurements, the antenna device most closely within line-of-sight of the subscriber is selected.

17. (currently amended) The method according to Claim 1415, wherein the positional determination is performed with a timing advance mechanism.

18. (currently amended) The method according to Claim 1415, wherein the subscriber data signal and the reference signal are transmitted using a time division multiple access method.

19. (previously presented) The method according to Claim 18, wherein the reference signal is a training sequence transmitted in a time slot used for synchronization.

20. (previously presented) The method according to Claim 19, wherein the wireless communication system is a GSM mobile radio system, and an extended training sequence of a synchronization time slot is used as the reference signal.

21. (currently amended) The method according to Claim 1415, wherein the reference signal is selected from a plurality of manufacturer-specific reference signals, and

the manufacturer-specific reference signals are stored on a transmit side in a table.

22. (currently amended) The method according to Claim 1415, wherein the at least two antenna devices have polarizations orthogonal to one another.

23. (currently amended) The method according to Claim 1415, wherein the at least two antenna devices have the same polarization, but are at a fixed distance from one another.

24. (currently amended) The method according to Claim 1215, wherein the antenna device used to send the reference signal is switched between the at least two antenna devices.

25. (cancelled)

26. (currently amended) The method according to Claim 2517, wherein the subscriber data signal and the reference signal are transmitted using a time division multiple access method.

27. (previously presented) The method according to Claim 26, wherein the reference signal is a training sequence transmitted in a time slot used for synchronization.

28. (previously presented) The method according to Claim 27, wherein the wireless communication system is a GSM mobile radio system, and an extended training sequence of a synchronization time slot is used as the reference signal.

29. (previously presented) The method according to Claim 28, wherein the reference signal is selected from a plurality of manufacturer-specific reference signals, and

the manufacturer-specific reference signals are stored on a transmit side in a table.

30. (previously presented) The method according to Claim 29, wherein the at least two antenna devices have polarizations orthogonal to one another.
